Problem A. Interesting drink

Time limit 2000 ms
Mem limit 262144 kB

Vasiliy likes to rest after a hard work, so you may often meet him in some bar nearby. As all programmers do, he loves the famous drink "Beecola", which can be bought in n different shops in the city. It's known that the price of one bottle in the shop i is equal to x_i coins.

Vasiliy plans to buy his favorite drink for q consecutive days. He knows, that on the i-th day he will be able to spent m_i coins. Now, for each of the days he want to know in how many different shops he can buy a bottle of "Beecola".

Input

The first line of the input contains a single integer n ($1 \le n \le 100\,000$) — the number of shops in the city that sell Vasiliy's favourite drink.

The second line contains n integers x_i ($1 \le x_i \le 100\,000$) — prices of the bottles of the drink in the i-th shop.

The third line contains a single integer q ($1 \le q \le 100\,000$) — the number of days Vasiliy plans to buy the drink.

Then follow q lines each containing one integer m_i ($1 \le m_i \le 10^9$) — the number of coins Vasiliy can spent on the i-th day.

Output

Print q integers. The i-th of them should be equal to the number of shops where Vasiliy will be able to buy a bottle of the drink on the i-th day.

Sample 1

Input	Output
5 3 10 8 6 11 4 1 10 3 11	0 4 1 5

Note

On the first day, Vasiliy won't be able to buy a drink in any of the shops.

On the second day, Vasiliy can buy a drink in the shops 1, 2, 3 and 4.

On the third day, Vasiliy can buy a drink only in the shop number 1.

Finally, on the last day Vasiliy can buy a drink in any shop.
